The Threat Model for U-Space: 21 assets, four layers, STRIDE and PASTA applied per asset

Each card gives the asset, its DREAD-S score and severity band, the STRIDE categories assigned to it, a representative attack type, and the PASTA stage that carries the analysis. Arrows show that an upper-layer asset relies on the one below it.

Legend C Critical, DREAD-S above 4.2 · H High, 3.4 to 4.2 · M Medium, up to 3.4 · ♦ maximum Safety Impact ($S = 5$)

S STRIDE category assigned · R not assigned · S Spoofing, T Tampering, R Repudiation, I Information disclosure, D Denial of service, E Elevation of privilege

DREAD-S $= (\sum_x v(x) + S)/6$ with $v(x) = 1 + 4(x-1)/9$ over Damage, Reproducibility, Exploitability, Affected assets and Discoverability; S is the SAIL-calibrated Safety Impact (1 to 5). Arrow $a \to b$: b relies on a, so a compromise of a can propagate upward to b. Source: threat_model_all_assets.csv.
